PORTFOLIO RATIONALE

**SQE (SMC Quant Equity)** is a concentrated, research-backed equity portfolio designed for **long-term wealth creation**. It aims to deliver superior risk-adjusted returns by investing in a select basket of high-quality Indian stocks across all major NSE indices.

- Stocks are selected using a **proprietary quantitative model** developed by SMC Research that evaluates each stock's risk-return profile relative to the broader market
- The portfolio holds **30 high-conviction positions** drawn from the full universe of NSE-listed companies — large, mid and small cap — with individual position sizes capped at **10%** to control single-stock risk
- Every month, the portfolio is **systematically rebalanced** to capture new opportunities and manage risk — there is no discretionary or emotional decision-making
- The model has consistently generated **alpha over the Nifty 500 benchmark** since inception, with a disciplined focus on both upside capture and downside protection

## HOW IT WORKS

### STEP 1

SMC Research runs the proprietary quant model every month

### STEP 2

Updated portfolio with buy/sell actions published on the dashboard

### STEP 3

Execute the rebalance trades at the start of each month

### STEP 4

Hold for 3–5 years for best risk-adjusted returns

## KEY RISK FACTORS

### MARKET RISK

Equity prices can decline sharply due to macroeconomic, geopolitical or company-specific factors. The portfolio has seen a maximum drawdown of -23.48% over the backtest period.

### CONCENTRATION RISK

The portfolio holds 30 stocks, but is top-heavy — the largest positions are capped at 10% each and the top 10 holdings account for roughly 76% of the portfolio. Sector concentration may arise during certain market phases.

### MODEL RISK

Past performance is not a guarantee of future results. Quantitative models may underperform during regime changes or unprecedented market events.

### LIQUIDITY RISK

All constituents are NSE-listed. As the universe spans mid and small cap companies alongside large caps, some holdings may trade with lower volumes, and liquidity can be temporarily limited during extreme market stress.

## DEFINITIONS AND DISCLOSURES

**CAGR** — Compound Annual Growth Rate is a measure of the growth of a portfolio. Returns generated each year differ; CAGR expresses them as the single annual rate that would produce the same terminal value over the period. For example, a portfolio returning 5%, 15% and -7% over three years has a CAGR of 3.94%. In this factsheet CAGR is computed on backtested model data from January 2020 onwards.

**Volatility Label** — Daily changes in stock prices cause fluctuation in the value of your investment. Each portfolio is categorised into one of three buckets — High, Medium or Low Volatility — by comparing the portfolio's volatility against that of the Nifty 100 Index. This portfolio's annualised volatility is 24.05%, placing it in the **High Volatility** bucket. High Volatility means changes in your investment value can be sudden and significant.

**Investment Horizon** — The manager's recommended holding duration. Short Term: <1 year. Medium Term: 1–3 years. Long Term: >3 years. This portfolio is recommended as **Long Term**.

**Asset Class** — Constituents are selected from a universe defined by the manager, and that universe is labelled the Asset Class. All NSE-listed stocks are ranked in decreasing order of market capitalisation: ranks 1–100 are Large Cap, 101–250 are Mid Cap, and above 250 are Small Cap. This portfolio is **Equity Multi Cap**, meaning constituents may be drawn from more than two of the Large, Mid and Small Cap categories.

**Rebalance** — The process of periodically reviewing and updating the constituents of a portfolio, so that the holdings continue to reflect the underlying strategy. This portfolio is rebalanced **monthly**, on the first trading day of each month.

**Holdings Distribution** — Constituents are grouped into segments, and the weight of a segment is the sum of the weights of all constituents in it. For example, if four constituents of 10% each are Large Cap, the Large Cap segment weight is 40%.

**Benchmark** — Portfolio performance in this factsheet is compared against the **Nifty 500** (CAGR 13.79% over the same period), which is the index CASE Platforms designates for the Equity Multi Cap asset class and is therefore the appropriate comparison for this portfolio. The **Nifty 50** (CAGR 10.94%) is shown alongside as a secondary broad-market reference only. Alpha is stated against the Nifty 500.

**CAGR:** Compound Annual Growth Rate — annualised return over the full period.

**Sharpe Ratio:** Risk-adjusted return per unit of total volatility.

**Sortino Ratio:** Risk-adjusted return penalising only downside deviation.

**Calmar Ratio:** CAGR divided by maximum drawdown.

**Max Drawdown:** Largest peak-to-trough decline during the period.

**Win Rate:** Percentage of months with positive returns.

**Alpha:** Portfolio CAGR minus Nifty 500 benchmark CAGR.

**VaR (95%):** Worst expected monthly loss at 95% confidence.

## GENERAL INVESTMENT DISCLOSURE

**⚠ IMPORTANT:** This factsheet is for **informational purposes only** and does not constitute investment advice, solicitation, or a recommendation to buy or sell any securities. Past performance is not indicative of future results. Investments in the securities market are subject to market risks. Read all related documents carefully before investing.

The performance data shown is based on a quantitative model simulation. Live performance may differ from model results due to transaction costs, taxes (STT, GST), impact cost, and execution timing. The portfolio is rebalanced monthly at month-open prices. **All returns, CAGR and risk figures shown in this factsheet are derived from backtested model data covering January 2020 onwards, and do not represent the returns of an actual live-traded portfolio.** Backtested results are hypothetical, are computed with the benefit of hindsight, and have inherent limitations. They have not been validated by an independent chartered accountant, nor verified by the Past Risk and Return Verification Agency (PaRRVA) or any other agency recognised by SEBI.

The volatility label (High/Medium/Low) is determined by comparing the portfolio's daily volatility against the Nifty 100 Index. High Volatility means that changes in your investment value can be sudden and significant.

## RISK DISCLOSURE

Investing in securities involves various types of risk that may impact your investment. Key risks affecting all asset classes include changes in: market volatility; general market conditions; trading volumes, liquidity and settlement periods; interest rates; the rate of inflation; domestic and global political, economic and financial developments; and policies, legal or regulatory frameworks set by government and other appropriate authorities.

**Risks relating to equity and equity-linked investments:** equity shares and equity-related instruments are volatile and prone to price fluctuation on a daily basis. Prices may be affected by trading volume volatility, currency exchange rates, company specific news and rumours, and other factors. **Mid cap and small cap stocks generally exhibit higher volatility than large cap stocks.** As this is a Multi Cap portfolio that draws from the full NSE universe, a meaningful portion of the holdings may fall in the mid and small cap segments at any given time.

In light of the risks involved, you should transact in securities only after understanding the associated risks. Please consider and assess all risk factors and your own risk tolerance before making investment decisions.

## MANAGER DISCLOSURE

**SMC Global Securities Ltd.** is registered with SEBI as a Research Analyst, with its registered office at 11/6B, Shanti Chamber, Pusa Road, New Delhi – 110005.
